## **Topic: Vectors**

Topic/Skill	Definition/Tips	Example
1. Translation	<b>Translate</b> means to <b>move a shape</b> . The shape does not change <b>size</b> or <b>orientation</b> .	Q 3 3 4 4 4 7 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9 9
2. Vector Notation	A vector can be written in 3 ways: <b>a</b> or $\overrightarrow{AB}$ or $\begin{pmatrix} 1\\ 3 \end{pmatrix}$	
3. Column Vector	In a column vector, the <b>top</b> number moves <b>left</b> (-) <b>or right</b> (+) and the <b>bottom</b> number moves <b>up</b> (+) <b>or down</b> (-)	$\binom{2}{3}$ means '2 right, 3 up' $\binom{-1}{-5}$ means '1 left, 5 down'
4. Vector	A vector is a quantity represented by an arrow with both <b>direction</b> and <b>magnitude</b> . $\overrightarrow{AB} = -\overrightarrow{BA}$	$\overrightarrow{AB} = \begin{pmatrix} 3 \\ 2 \end{pmatrix}$
5. Magnitude	Magnitude is defined as the <b>length</b> of a vector.	3     Magnitude (length) can be calculated using Pythagoras Theorem: 3² + 4² = 25 J25 = 5
6. Equal Vectors	If two vectors have the <b>same magnitude</b> <b>and direction</b> , they are <b>equal</b> .	
7. Parallel Vectors	Parallel vectors are multiples of each other.	2 <b>a</b> + <b>b</b> and 4 <b>a</b> +2 <b>b</b> are parallel as they are multiple of each other.

0 0 11		
8. Collinear Vectors	Collinear vectors are vectors that are on the same line. To show that two vectors are collinear, show that one vector is a <b>multiple</b> of the other (parallel) <b>AND</b> that both vectors share a point.	A C
9. Resultant Vector	The <b>resultant</b> vector is the vector that results from <b>adding</b> two or more vectors together. The resultant can also be shown by <b>lining</b> <b>up</b> the <b>head</b> of one vector with the <b>tail</b> of the other.	if $\underline{\mathbf{a}} = \begin{pmatrix} 4 \\ 4 \end{pmatrix}$ and $\underline{\mathbf{b}} = \begin{pmatrix} 2 \\ -2 \end{pmatrix}$ then $\underline{\mathbf{a}} + \underline{\mathbf{b}} = \begin{pmatrix} 4 \\ 4 \end{pmatrix} + \begin{pmatrix} 2 \\ -2 \end{pmatrix} = \begin{pmatrix} 6 \\ 2 \end{pmatrix}$
10. Scalar of a Vector	A scalar is the number we multiply a vector by.	Example: $3a + 2b =$ $= 3\binom{2}{1} + 2\binom{4}{-1}$ $= \binom{6}{3} + \binom{8}{-2}$ $= \binom{14}{1}$
11. Vector Geometry	$\overrightarrow{OA} = a  \overrightarrow{AO} = -a$ $\overrightarrow{OB} = b  \overrightarrow{BO} = -a + b = b - a$ $\overrightarrow{AB} = \overrightarrow{AO} + \overrightarrow{OB} = -a + b = b - a$ $\overrightarrow{AB} = \overrightarrow{AO} + \overrightarrow{OB} = -a + b = b - a$ $\overrightarrow{AB} = \overrightarrow{AO} + \overrightarrow{OA} = -b + a = a - b$	Example 1: X is the midpoint of AB. Find $\overrightarrow{OX}$ Answer: Draw X on the original diagram $\overrightarrow{O}$ $\overrightarrow{O}$ $\overrightarrow{O}$ $\overrightarrow{O}$ $\overrightarrow{A}$ Now build up a journey. You could use $\overrightarrow{OX} = \overrightarrow{OA} + \frac{1}{2}\overrightarrow{AB}$ . This will give: $\overrightarrow{OX} = a + \frac{1}{2}(b-a)$ . This will simplify to $\frac{1}{2}a + \frac{1}{2}b$ or $\frac{1}{2}(a+b)$
